DETAILED ACTION

In view of the APPEAL BRIEF filed on 08/28/2007, PROSECUTION IS HEREBY REOPENED. A new ground of rejection is set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

- (1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,
- (2) initiate a new appeal by filing a notice of appeal under 37 CFR 41.31 followed by an appeal brief under 37 CFR 41.37. The previously paid notice of appeal fee and appeal brief fee can be applied to the new appeal. If, however, the appeal fees set forth in 37 CFR 41.20 have been increased since they were previously paid, then appellant must pay the difference between the increased fees and the amount previously paid.

A Supervisory Patent Examiner (SPE) has approved of reopening prosecution by signing below:

Akm Ullah.

Response to Arguments

Examiner appreciated applicant's consideration of claim 17 to be rejected under U.S.C. 102(b) as being anticipated by Modgil despite the fact that claim 17 was skipped as typo error from the main heading of the rejection during the last appeal Brief.

Applicant's arguments with respect to claims 1-13 and 15-21 have been considered but are most in view of the new ground(s) of rejection (see rejection below).

Art Unit: 2838

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 2, 3, 5, 7 and 17 are rejected under 35 U.S.C. 102(b) as being anticipated by Modgil (US 2002/0111756).

With respect to claims 1 and 7 Modgil discloses a battery safety monitor system (par.0002, lines 1-5) comprising: at least one battery (fig. 3, 104) comprising at least one cell string, wherein said at least one cell string is capable of outputting voltage signals; at least one zener diode (fig. 12, 1232), operatively coupled to said at least one battery cell string 104, capable of receiving and reducing voltage signals, and capable of outputting voltage signals (18 V zener, fig. 12, 1232); at least one safety device (fig. 3, 356, and fig. 12, 1232; par. 0090, lines 1-6), operatively coupled to said at least one battery cell string (104, is a definition of a battery), capable of preventing damage to said at least one battery cell string; a microcontroller (fig. 12, 300), operatively coupled to said at least one zener diode 1232, capable of receiving and outputting data; display device (fig. 15, 1530), operatively coupled to said microcontroller 1528, capable of receiving data, and capable of displaying at least one battery voltage level (capable about 5 volts); a power supply (fig. 15D, 1518), operatively coupled to said microcontroller1528 and said display device 1530, capable of supplying power to said microcontroller 1528 and said display device 1530.

Art Unit: 2838

With respect to claim 2, Modgil discloses safety device is selected from the group consisting of PTC, thermal fuse, fuse, isolation diode, wetness detector and optoisolator (fig. 15 D, 1518-fuse).

With respect to claim 3, Modgil discloses a display device (fig. 15, 1530) is selected from the group consisting of visual alarms (blinking light of 1530), audible alarms (1534, speaker), relay switches (fig. 16, 1614) and serial interfaces coupled to display computers (1532 and 1530).

With respect to claim 5, Modgil discloses a battery safety monitor system further comprises an A/D converter (fig. 12, A/D Converter), operatively coupled to said at least one zener diode (1232) and said microcontroller (300), capable of converting voltage signals to digital signals, and capable of outputting digital signals (par. 0084) to said microcontroller (300), and capable of receiving control signals from said microcontroller (par. 0084).

With respect claim 17, Modgil discloses a battery safety monitor system (par., lines 1-5) comprising: at least one battery (fig. 3, 104) comprising at least one cell string, wherein said at least one cell string is capable of outputting voltage signals; at least one zener diode (fig. 12, 1232), operatively coupled to said at least one battery cell string 104, capable of receiving and reducing voltage signals, and capable of outputting voltage signals (18 V zener); at least one safety device (fig. 3, 356, and fig. 12, 1232; par. 90, lines 1-6), operatively coupled to said at least one battery cell string (104, is a definition of a battery), capable of preventing damage to said at least one battery cell string; a microcontroller (fig. 12, 300), operatively coupled to said at least one zener

Art Unit: 2838

diode 1232, capable of receiving and outputting data; display device (fig. 15, 1530), operatively coupled to said microcontroller 1528, capable of receiving data, and capable of displaying at least one battery voltage level (capable about 5 volts); an A/D converter (fig. 12, A/D Converter); a power supply (fig. 15D, 1518), operatively coupled to said microcontroller 1528 and said display device 1530, capable of supplying power to said microcontroller 1528 and said display device 1530, and separate power supply (page 15, par. 0143; power transmission circuit 102, which is an internal combustion engine and alternators that supply power or recharge the battery) and a battery (fig. 12, 104).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 4, 6, 8-13 and 18-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Modgil (US 2002/0111756) in view of Kopera (US 5,646,534).

With respect to claims 4, 8 and 18, Modgil discloses a battery safety monitoring system, a zener diode capable of receiving voltage signals, and an A/D converter, but does not disclose a plurality of batteries and an analog multiplexer, and an optoisolator.

Kopera, however, discloses a plurality of batteries (fig. 1, 14) and an analog multiplexer 30 (see also col. 3, lines 21-22), an optoisolator (fig. 1, 20).

Modgil and Kopera are analogous arts because they are from the same field of endeavor namely battery monitor for vehicles and safety system.

Art Unit: 2838

At the time of the invention it would have been obvious to a person having ordinary skill in the art to provide plurality of batteries, analog multiplexer and optoisolator as taught by Kopera to the vehicle safety of Modgil to ensure the safety of the battery of a vehicle.

The motivation would have been that the use of multiple batteries is used to produce more enough power for cars and vans (col. 2, lines 41-43); and a analog multiplexer used to multiplex multiple inputs into one output (see col. 3, lines 20-32); and an optoisolator to transmit a high power digital signal across the boarder to the low voltage non-isolated side (col. 4, lines 33-37).

Therefore it would have been obvious to combine Modgil with Kopera for the benefit of battery safety - security system to obtain the invention as specified in claim 4.

Regarding claim 6, Modgil discloses a battery safety monitoring system with a microcontroller, display device and a power supply, but does not disclose an optoisolator. Kopera, on the other hand, discloses an optoisolator (fig. 1, 20). It would have been obvious for one having ordinary skill in the art would provide an optoisolator to transmit a high power digital signal across the boarder to the low voltage non-isolated side (col. 4, lines 33-37).

With respect to claims 9, 10 and 19, Modgil discloses a battery safety monitoring system with data collection and display device and a microcontroller, but does not disclose an optoisolator with a serial interface and a connector (or UART) operatively coupled to optoisolator.

Art Unit: 2838

Kopera, however, discloses an optoisolator (fig. 1, 20) operatively coupled to said microcontroller 52; a connector (the boarder 20, see col. 4, lines 34-36); UART (Universal Asynchronous receiver/transmitter) is a well known connector used to connect or interface a microcontroller to its serial device, and is inherent to a microcontroller, specially imbedded in the microcontroller of the vehicle's safety system) (claim 10), operatively coupled to said optoisolator and, capable of receiving and outputting digital signals (48), and capable of receiving and outputting power (64).

The motivation would have been that since optoisolator is used in preventing reverse current and is a combination of a photodiode and a phototransistor where an optical signal from the photodiode is transmitted across the boarder (considered as a connector between 16 and 18; see fig. 1) on the low voltage side (col. 4, lines 33-36).

Regarding claims 11 and 12, Modgil discloses a battery safety monitoring system with a microcontroller and A/D converter, but does not expressly discloses said connector comprises long wire and a wet (moisture) detector respectively.

Kopera discloses connector comprises long wires (col. 2, 1-8). These wires help transmit battery voltage and battery temperature signals from the battery monitor to the vehicle controller (col. 2, lines 3-5). Regarding a wetness detector, it is implicitly defined (electrolyte leakage of a battery is detected when a voltmeter (voltage sensor) or a thermal sensor reads a decrease in the temperature of a battery due to electrolyte leakages; voltmeter and temperature sensor are inherent of a vehicle safety monitoring system).

Art Unit: 2838

Regarding claims 13 and 20, Modgil discloses a data collection and display device (fig. 15, 1530, 1528), a display device, a power supply and further comprises: a second microcontroller (it is obvious that a typical mid range vehicle has as many as 50 or more microcontrollers), but does not expressly disclose a digital MUX. Kopera, however, discloses a multiplexer 30 (see also col. 3, lines 21-22, but the multiplexer is an analog mux that receives voltages signals of analog inputs; and at the time of the invention it would have been obvious to a person of ordinary skill in the art to provide a digital multiplexer that receives a digital signals and select from one of the plurality of theses signals.

With respect to claim 21, Modgil discloses a positive thermal coefficient operatively coupled in series, a thermal fuse with battery cell (fig. 3, thermal sense elements 356 to 202); a fuse operatively coupled in series with battery cell string (fig. 15D, element 1518); but does not disclose an isolation diode operatively coupled with fuse, and analog multiplexer.

Kopera discloses an isolation diode operatively coupled with fuse (col. 4, lines 26-38), analog multiplexer (col. 3, lines 20-23; col. 5, lines 15-34).

Modgil and Kopera are analogous arts because they are from the same field of endeavor namely battery monitor for vehicles and safety system.

At the time of the invention it would have been obvious to a person having ordinary skill in the art to provide an isolation diode operatively coupled with fuse and, analog multiplexer as taught by Kopera to the vehicle safety of Modgil to ensure the safety use of the battery of a vehicle.

Art Unit: 2838

The reason is that and an isolation diode prevents one segment from interacting with another array segment, specially used to prevent current from flowing backwards, and damage the circuit; and an analog multiplexer used to multiplex multiple inputs into one output (see col. 3, lines 20-32).

The examiner notes that all the claimed elements of applicant's inventions were known in the prior art (e.g. thermal fuse, PTC, isolation diode and analog multiplexer, etc., and battery cell strings) and one skilled in the art could have combined the elements as claimed by known methods with no change in their respective functions, and the combination would have yielded predictable results to one of ordinary skill in the art at the time of the invention.

Proper motivation/rationale to combine is as given in the office action. See KSR, 127 S. Ct. at 1740, 82 USPQ2d at 1396.

Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Modgil (US 2002/0111756) in view of Hemminger et al (US 6,628,207).

With respect to claim 15, Modgil discloses battery safety monitoring system with at least one battery, but does not disclose the battery cells are lithium based battery.

Hemminger et al (hereinafter, Hemminger), however discloses a lithium-based battery (col. 4, lines 31-32).

Modgil and Hemminger are analogous arts because they are from the same field of endeavor namely battery monitor and warning safety system. At the time of the invention it would have been obvious to a person having ordinary skill in the art to

11/00/11/01 144/11/2011 10/002,0

Art Unit: 2838

provide lithium based battery as taught by Hemminger to the vehicle safety of Modgil to ensure the life and safety of the battery of a vehicle.

The motivation would have been that the use of lithium-based battery is used to produce more power and for longer period of time since lithium based batteries are well known in the art for their high energy output.

Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Modgil (US 2002/0111756) in view of Kopera (US 5,646,534) further in view of Hemminger et al (US 6,628,207).

With respect to claim 16, combined references of Modgil and Kopera disclose battery safety monitoring system with wetness detector, but do not disclose that wetness detector configured to produce reduced voltage when thionyl chloride is used.

Hemminger discloses that the battery cell used is a lithium thionyl chloride cells (col. 4, lines 31-32). The reason is that using a lithium thionyl cell helps to operate in a wide temperature range, and relatively smaller in size (col. 9, lines 6-10) so that it fits in any movable electronic apparatus or vehicles.

Contact Information

Any inquiry concerning this communication or earlier communications from the examiner should be directed to YALKEW FANTU whose telephone number is (571)272-8928. The examiner can normally be reached on M - F: 7- 4.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Akm E. Ullah can be reached on 571-272-2361. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2838

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

/Akm Enayet Ullah/ Supervisory Patent Examiner, Art Unit 2838
